Generally, the incidence of lameness in dairy cows has been approximately 25%, ranging from 1 to 55% [6, 7]. According to literature data, the most prevalent claw disorders in intensive dairy...

*(PDF) Economic Cost of Lameness in Dairy Cattle Herds*  
During the summer grazing months many producers run into issues with lame cattle. The effects of lameness may show itself by decreased fertility, weight loss, decreased performance, and increased labor and medicine costs. It has been estimated that 88-92% of lameness in cattle stems from the foot. Several issues could be the culprit, but we will review some of the common causes and the key differences between the clinical signs.
