Arthrology, the study of the classification, structure, and function of joints, is an important foundation for the overall study of kinesiology. Aging, long-term immobilization, trauma, and disease all affect the structure and ultimate function of joints. These factors also significantly influence the quality and quantity of human movement.

Structure of synovial joints. There are 6 different types of synovial joints: Plane (Inter-Tarsal joints) – allows limited gliding movements. Hinge (Elbow) – allows movements along one axis for flexion or extension. Pivot (C1 to C2 vertebral joint) – allows rotational movements and some bending.

Classification of Joints Joints are classified according to their structure (what they are made of) of their function (the type and extent of movement they permit). The structural classification recognizes recognizes three main types of joints: Fibrous joints, Cartilaginous joints, and Synovial joints. Fibrous Joints Really tight; very little movement as they are held together by fibrous ...
