The changing distance separating the Moon and Earth also affects tide heights. When the Moon is closest, at perigee, the range increases, and when it is at apogee, the range shrinks. Every 7 1/2 lunations (the full cycles from full moon to new to full), perigee coincides with either a new or full moon causing perigean spring tides with the largest tidal range.

The great majority of large breakers seen at a beach result from distant winds. Five factors influence the formation of the flow structures in wind waves: Wind speed or strength relative to wave speed - the wind must be moving faster than the wave crest for energy transfer; The uninterrupted distance of open water over which the wind blows without significant change in direction (called the ...
