Statistical Methods for Reliability Data updates and improves established techniques as it demonstrates how to apply the new graphical, numerical, or simulation-based methods to a broad range of models encountered in reliability data analysis. It includes methods for planning reliability studies and analyzing degradation data, simulation methods used to complement large-sample asymptotic theory, general likelihood-based methods of handling arbitrarily censored data and truncated data, and more.

The product moment method of correlation is a significant method for estimating reliability of two sets of scores. Thus, a high correlation between two sets of scores indicates that the test is reliable. Means, it shows that the scores obtained in first administration resemble with the scores obtained in second administration of the same test.

Survival analysis is a branch of statistics for analyzing the expected duration of time until one or more events happen, such as death in biological organisms and failure in mechanical systems. Survival analysis -

Wikipedia

Since the 1990s, statistical methods have been developed for making reliability inferences from degradation data. Initially these were developed by researchers or engineers in need of the methods. Statistical methods for the analysis of degradation data are, however, now beginning to be deployed in commercial

which the tool measures what
it claims to measure.
Validity is based on the
